

Temporary Crown Instructions

You have received a temporary crown today. This crown is designed to protect your underlying tooth structure while the permanent crown is being fabricated in the lab.

The type of cement that holds this crown in place is very weak; therefore, you have to follow the instructions below to prevent the temporary crown from dislodging.

The homecare for a temporary crown:

- Don't floss around the temporary crown, for it will dislodge; however, proper brushing is a must. Don't eat on the temporary crown, for it will dislodge; you can eat on the other side of your mouth.
- No chewing gum, hard candy, or sticky food consumption at all until you receive your permanent crown.
- If the temporary crown falls off, please place it in a clean zip-lock bag and call us to make an appointment for re-cementation.
